2 CONTENTS

UTILITIES FOR INTERFACING WITH THE STANDARD LIBRARY'S ATEXIT MODULE.

```
class sage.cpython.atexit.restore_atexit
    Bases: object
```

Context manager that restores the state of the atexit module to its previous state when exiting the context.

INPUT:

- run (bool, default: False) if True, when exiting the context (but before restoring the old exit functions), run all atexit functions which were added inside the context.
- clear (bool, default: equal to run) if True, clear already registered atexit handlers upon entering the context.

Warning: The combination run=True and clear=False will cause already-registered exit functions to be run twice: once when exiting the context and again when exiting Python.

EXAMPLES:

For this example we will wrap the entire example with restore_atexit (clear=True) so as to start with a fresh atexit module state for the sake of the example.

Note that the function atexit._run_exitfuncs() runs all registered handlers, and then clears the list of handlers, so we can use it to test manipulation of the atexit state:

```
sage: import atexit
sage: from sage.cpython.atexit import restore_atexit
sage: def handler(*args, **kwargs):
         import sys # see https://trac.sagemath.org/ticket/25270#comment:56
. . . . :
         sys.stdout.write(str((args, kwargs)))
         sys.stdout.write('\n')
sage: atexit.register(handler, 1, 2, c=3)
<function handler at 0x...>
sage: atexit.register(handler, 4, 5, d=6)
<function handler at 0x...>
sage: with restore_atexit(clear=True):
        atexit._run_exitfuncs() # Should be none registered
        atexit.register(handler, 1, 2, c=3)
. . . . :
. . . . :
        with restore_atexit():
              atexit._run_exitfuncs() # Run just registered handler
....: atexit._run_exitfuncs() # Handler should be run again
<function handler at 0x...>
```

```
((1, 2), {'c': 3})
((1, 2), {'c': 3})
```

We test the run option:

```
sage: with restore_atexit(run=True):
....:  # this handler is run when exiting the context
....:  _ = atexit.register(handler, 7, 8, e=9)
((7, 8), {'e': 9})
sage: with restore_atexit(clear=False, run=True):
....:  # original handlers are run when exiting the context
....: pass
((4, 5), {'d': 6})
((1, 2), {'c': 3})
```

The original handlers are still in place:

```
sage: atexit._run_exitfuncs()
((4, 5), {'d': 6})
((1, 2), {'c': 3})
```

STRING <-> BYTES ENCODING/DECODING

```
sage.cpython.string.bytes_to_str(b, encoding=None, errors=None)
Convert bytes to str.
```

On Python 2 this is a no-op since bytes is str. On Python 3 this decodes the given bytes to a Python 3 unicode str using the specified encoding.

EXAMPLES:

```
sage: import six
sage: from sage.cpython.string import bytes_to_str
sage: s = bytes_to_str(b'\xcf\x80')
sage: if six.PY2:
....: s == b'\xcf\x80'
....: else:
....: s == u'\pi'
True
sage: bytes_to_str([])
Traceback (most recent call last):
...
TypeError: expected bytes, list found
```

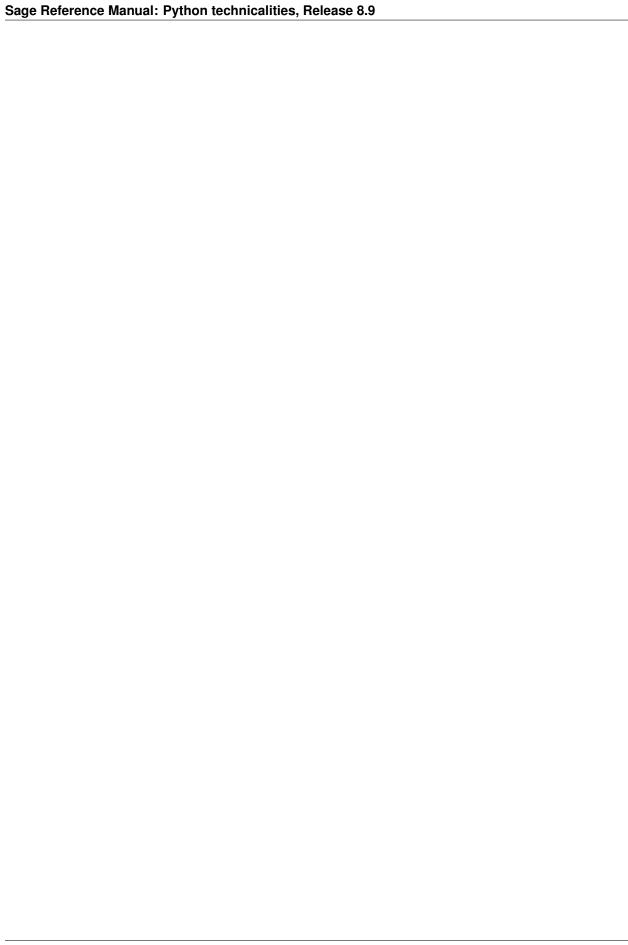

sage.cpython.string.str_to_bytes(s, encoding=None, errors=None)
Convert str or unicode to bytes.

On Python 3 this encodes the given str to a Python 3 bytes using the specified encoding.

On Python 2 this is a no-op on str input since str is bytes. However, this function also accepts Python 2 unicode objects and treats them the same as Python 3 unicode str objects.

EXAMPLES:

```
sage: import six
sage: from sage.cpython.string import str_to_bytes
sage: if six.PY2:
...: bs = [str_to_bytes('\xcf\x80'), str_to_bytes(u'\pi')]
...: else:
...: bs = [str_to_bytes(u'\pi')]
sage: all(b == b'\xcf\x80' for b in bs)
True
sage: str_to_bytes([])
Traceback (most recent call last):
...
TypeError: expected str... list found
```

VARIOUS FUNCTIONS TO DEBUG PYTHON INTERNALS

```
sage.cpython.debug.getattr_debug(obj, name, default='_no_default')
A re-implementation of getattr() with lots of debugging info.
```

This will correctly use __getattr__ if needed. On the other hand, it assumes a generic (not overridden) implementation of __getattribute__. Note that Cython implements __getattr__ for a cdef class using __getattribute__, so this will not detect a __getattr__ in that case.

INPUT:

- obj the object whose attribute is requested
- name (string) the name of the attribute
- default default value to return if attribute was not found

EXAMPLES:

```
sage: _ = getattr_debug(list, "reverse")
getattr_debug(obj=<type 'list'>, name='reverse'):
 type(obj) = <type 'type'>
 object has __dict__ slot (<type 'dict'>)
 did not find 'reverse' in MRO classes
 found 'reverse' in object __dict__
 returning <method 'reverse' of 'list' objects> (<type 'method_descriptor'>)
sage: _ = getattr_debug([], "reverse")
getattr_debug(obj=[], name='reverse'):
 type(obj) = <type 'list'>
 object does not have __dict__ slot
 found 'reverse' in dict of <type 'list'>
 got <method 'reverse' of 'list' objects> (<type 'method_descriptor'>)
 attribute is ordinary descriptor (has __get__)
 calling __get__()
 returning <built-in method reverse of list object at 0x... (<type 'builtin_
→function_or_method'>)
sage: _ = getattr_debug([], "__doc__")
getattr_debug(obj=[], name='__doc__'):
 type(obj) = <type 'list'>
 object does not have __dict__ slot
 found '__doc__' in dict of <type 'list'>
 got ... 'str'>)
 returning ... 'str'>)
sage: _ = getattr_debug(gp(1), "log")
getattr_debug(obj=1, name='log'):
 type(obj) = <class 'sage.interfaces.gp.GpElement'>
 object has __dict__ slot (<type 'dict'>)
 did not find 'log' in MRO classes
```

```
object __dict__ does not have 'log'
 calling __getattr__()
 returning log (<class 'sage.interfaces.expect.FunctionElement'>)
sage: from ipywidgets import IntSlider
sage: _ = getattr_debug(IntSlider(), "value")
getattr_debug(obj=IntSlider(value=0), name='value'):
 type(obj) = <class 'ipywidgets.widgets.widget_int.IntSlider'>
 object has __dict__ slot (<type 'dict'>)
 found 'value' in dict of <class 'ipywidgets.widgets.widget_int._Int'>
 got <traitlets.traitlets.CInt object at ... (<class 'traitlets.traitlets.CInt'>)
 attribute is data descriptor (has __get__ and __set__)
 ignoring __dict__ because we have a data descriptor
 calling __get__()
 returning 0 (<type 'int'>)
sage: _ = getattr_debug(1, "foo")
Traceback (most recent call last):
AttributeError: 'sage.rings.integer' object has no attribute 'foo'
sage: _ = getattr_debug(1, "foo", "xyz")
getattr_debug(obj=1, name='foo'):
 type(obj) = <type 'sage.rings.integer.Integer'>
 object does not have __dict__ slot
 did not find 'foo' in MRO classes
 class does not have __getattr__
 attribute not found
 returning default 'xyz'
```

sage.cpython.debug.shortrepr(obj, max=50)

Return repr (obj) bounded to max characters. If the string is too long, it is truncated and ~~~ is added to the end.

EXAMPLES:

```
sage: from sage.cpython.debug import shortrepr
sage: print(shortrepr("Hello world!"))
'Hello world!'
sage: print(shortrepr("Hello world!" * 4))
'Hello world!Hello world!Hello world!'
sage: print(shortrepr("Hello world!Hello world!'
sage: print(shortrepr("Hello world!" * 5))
'Hello world!Hello world!Hello world!Hello worl~~~
```

$sage.cpython.debug.type_debug(\mathit{cls})$

Print all internals of the type cls

EXAMPLES:

```
sage: type_debug(object) # random
<type 'object'> (0x7fc57da7f040)
  ob_refcnt: 9739
  ob_type: <type 'type'>

FOUR

VARIANTS OF GETATTR()

```
class sage.cpython.getattr.AttributeErrorMessage
    Bases: object
```

Tries to emulate the standard Python AttributeError message.

Note: The typical fate of an attribute error is being caught. Hence, under normal circumstances, nobody will ever see the error message. The idea for this class is to provide an object that is fast to create and whose string representation is an attribute error's message. That string representation is only created if someone wants to see it.

EXAMPLES:

```
sage: from sage.cpython.getattr import AttributeErrorMessage
sage: AttributeErrorMessage(int(1), 'bla')
'int' object has no attribute 'bla'
```

AUTHOR:

• Simon King (2011-05-21)

cls

name

```
\verb|sage.cpython.getattr.dir_with_other_class| (\textit{self}, \textit{cls})
```

Emulates dir(self), as if self was also an instance cls, right after caller_class in the method resolution order(self.__class__.mro())

EXAMPLES:

```
sage: class B(object):
....:    b = 2
....:    c = 3
....:    d = 4
sage: x = A()
sage: x.c = 1; x.e = 1
sage: from sage.cpython.getattr import dir_with_other_class
sage: dir_with_other_class(x, B)
[..., 'a', 'b', 'c', 'd', 'e']
```

Check that objects without dicts are well handled:

```
sage: cython("cdef class A:\n cdef public int a")
sage: cython("cdef class B:\n cdef public int b")
sage: x = A()
sage: x.a = 1
sage: hasattr(x,'__dict__')
False
sage: dir_with_other_class(x, B)
[..., 'a', 'b']
```

sage.cpython.getattr_from_other_class(self, cls, name)

Emulate getattr (self, name), as if self was an instance of cls.

INPUT:

- self some object
- cls a new-style class
- name a string

If self is an instance of cls, raises an AttributeError, to avoid a double lookup. This function is intended to be called from __getattr__, and so should not be called if name is an attribute of self.

EXAMPLES:

```
sage: from sage.cpython.getattr import getattr_from_other_class
sage: class A(object):
          def inc(self):
. . . . :
                return self + 1
. . . . :
          @staticmethod
. . . . :
           def greeting():
. . . . :
. . . . :
                print("Hello World!")
. . . . :
          @lazy_attribute
. . . . :
           def lazy_attribute(self):
. . . . :
               return repr(self)
sage: getattr_from_other_class(1, A, "inc")
<bound method A.inc of 1>
sage: getattr_from_other_class(1, A, "inc")()
```

Static methods work:

```
sage: getattr_from_other_class(1, A, "greeting")()
Hello World!
```

Caveat: lazy attributes work with extension types only if they allow attribute assignment or have a public attribute __cached_methods of type <dict>. This condition is satisfied, e.g., by any class that is derived from Parent:

The integer ring is a parent, so, lazy attributes work:

In general, descriptors are not yet well supported, because they often do not accept to be cheated with the type of their instance:

```
sage: A.__weakref__.__get__(1)
Traceback (most recent call last):
...
TypeError: descriptor '__weakref__' for 'A' objects doesn't apply
to 'sage.rings.integer.Integer' object
```

When this occurs, an AttributeError is raised:

```
sage: getattr_from_other_class(1, A, "__weakref__")
Traceback (most recent call last):
...
AttributeError: 'sage.rings.integer.Integer' object has no attribute '__weakref__'
```

This was caught by trac ticket #8296 for which we do a couple more tests:

```
sage: "__weakref__" in dir(A)
True
sage: "__weakref__" in dir(1) # py2
False
sage: 1.__weakref__
Traceback (most recent call last):
AttributeError: 'sage.rings.integer.Integer' object has no attribute '__weakref__'
sage: n = 1
                                        # not tested: only works in interactive
sage: ip = get_ipython()
⇔shell
sage: ip.magic_psearch('n.N')
                                         # not tested: only works in interactive_
⇔shell
n.N
sage: ip.magic_psearch('n.__weakref__') # not tested: only works in interactive_
⇔shell
```

Caveat: When __call__ is not defined for instances, using A.__call__ yields the method __call__ of the class. We use a workaround but there is no guarantee for robustness.

sage: getattr_from_other_class(1, A, "__call__") Traceback (most recent call last): ... AttributeError: 'sage.rings.integer.Integer' object has no attribute '__call__'

```
sage.cpython.getattr.raw_getattr(obj, name)
```

Like getattr (obj, name) but without invoking the binding behavior of descriptors under normal attribute access. This can be used to easily get unbound methods or other descriptors.

This ignores __getattribute__ hooks but it does support __getattr__.

Note: For Cython classes, __getattr__ is actually implemented as __getattribute__, which means that it is not supported by raw_getattr.

EXAMPLES:

```
sage: class X:
. . . . :
         @property
. . . . :
         def prop(self):
           return 42
        def method(self):
. . . . :
             pass
. . . . :
         def __getattr__(self, name):
. . . . :
. . . . :
             return "magic " + name
sage: raw_getattr(X, "prop")
property object at ...>
sage: raw_getattr(X, "method")
<function ...method at ...>
sage: raw getattr(X, "attr")
Traceback (most recent call last):
AttributeError: '...' object has no attribute 'attr'
sage: x = X()
sage: raw_getattr(x, "prop")
property object at ...>
sage: raw_getattr(x, "method")
<function ...method at ...>
sage: raw_getattr(x, "attr")
'magic attr'
sage: x.__dict__["prop"] = 'no'
sage: x.__dict__["method"] = 'yes'
sage: x.__dict__["attr"] = 'ok'
sage: raw_getattr(x, "prop")
property object at ...>
sage: raw_getattr(x, "method")
'yes'
sage: raw_getattr(x, "attr")
'ok'
```

The same tests with an inherited new-style class:

```
sage: class Y(X, object):
....: pass
sage: raw_getattr(Y, "prop")
cproperty object at ...>
sage: raw_getattr(Y, "method")
```

```
<function ...method at ...>
sage: raw_getattr(Y, "attr")
Traceback (most recent call last):
AttributeError: '...' object has no attribute 'attr'
sage: y = Y()
sage: raw_getattr(y, "prop")
operty object at ...>
sage: raw_getattr(y, "method")
<function ...method at ...>
sage: raw_getattr(y, "attr")
'magic attr'
sage: y.__dict__["prop"] = 'no'
sage: y.__dict__["method"] = 'yes'
sage: y.__dict__["attr"] = 'ok'
sage: raw_getattr(y, "prop")
property object at ...>
sage: raw_getattr(y, "method")
'yes'
sage: raw_getattr(y, "attr")
'ok'
```

CHAPTER

FIVE

METACLASSES FOR CYTHON EXTENSION TYPES

Cython does not support metaclasses, but this module can be used to implement metaclasses for extension types.

Warning: This module has many caveats and you can easily get segfaults if you make a mistake. It relies on undocumented Python and Cython behaviour, so things might break in future versions.

5.1 How to use

To enable this metaclass mechanism, you need to put cimport sage.cpython.cython_metaclass in your module (in the .pxd file if you are using one).

In the extension type (a.k.a. cdef class) for which you want to define a metaclass, define a method __getmetaclass__ with a single unused argument. This method should return a type to be used as metaclass:

```
cimport sage.cpython.cython_metaclass
cdef class MyCustomType(object):
    def __getmetaclass__(_):
        from foo import MyMetaclass
        return MyMetaclass
```

The above __getmetaclass__ method is analogous to __metaclass__ = MyMetaclass in Python 2.

Warning: __getmetaclass__ must be defined as an ordinary method taking a single argument, but this argument should not be used in the method (it will be None).

When a type cls is being constructed with metaclass meta, then meta.__init__(cls, None, None, None) is called from Cython. In Python, this would be meta.__init__(cls, name, bases, dict).

Warning: The __getmetaclass__ method is called while the type is being created during the import of the module. Therefore, __getmetaclass__ should not refer to any global objects, including the type being created or other types defined or imported in the module (unless you are very careful). Note that non-imported cdef functions are not Python objects, so those are safe to call.

The same warning applies to the __init__ method of the metaclass.

Warning: The __new__ method of the metaclass (including the __cinit__ method for Cython extension types) is never called if you're using this from Cython. In particular, the metaclass cannot have any attributes or virtual methods.

EXAMPLES:

```
sage: cython('''
....: cimport sage.cpython.cython_metaclass
....: cdef class MyCustomType(object):
....: def __getmetaclass__(_):
             class MyMetaclass(type):
. . . . :
                 def __init__(*args):
                      print("Calling MyMetaclass.__init__{{}}".format(args))
. . . . :
...:
            return MyMetaclass
....: cdef class MyDerivedType (MyCustomType):
        pass
...: ''')
Calling MyMetaclass.__init__(<type '...MyCustomType'>, None, None, None)
Calling MyMetaclass.__init__(<type '...MyDerivedType'>, None, None, None)
sage: MyCustomType.__class_
<class '...MyMetaclass'>
sage: class MyPythonType(MyDerivedType):
         pass
Calling MyMetaclass.__init__(<class '...MyPythonType'>, 'MyPythonType', (<type '...
→MyDerivedType'>,), {...})
```

5.2 Implementation

All this is implemented by defining

```
#define PyTypeReady(t) Sage_PyType_Ready(t)
```

and then implementing the function Sage_PyType_Ready(t) which first calls PyType_Ready(t) and then handles the metaclass stuff.

CHAPTER

SIX

SLOT WRAPPERS

A slot wrapper is installed in the dict of an extension type to access a special method implemented in C. For example, object.__init__ or Integer.__lt__. Note that slot wrappers are always unbound (there is a bound variant called method-wrapper).

EXAMPLES:

```
sage: int.__add__
<slot wrapper '__add__' of 'int' objects>
```

Pure Python classes have normal methods, not slot wrappers:

sage.cpython.wrapperdescr.wrapperdescr_call (slotwrapper, self, *args, **kwds)
Call a slot wrapper without any type checks.

The main reason to use this is to call arithmetic slots like __mul__ without having to worry about whether to call T.__mul__ (a, b) or T.__rmul__ (b, a).

INPUT:

- slotwrapper a slot wrapper (for example int.__add__).
- self the first positional argument. Normally, this should be of the correct type (an int when calling int.__add__). However, this check is skipped: you can pass an arbitrary object.
- *args, **kwds further arguments.

Warning: Since this skips type checks, it can easily crash Python if used incorrectly.

EXAMPLES:

```
sage: from sage.cpython.wrapperdescr import wrapperdescr_call
sage: wrapperdescr_call(Integer.__mul__, 6, 9)
54
sage: wrapperdescr_call(Integer.__mul__, 7/5, 9)
63/5
sage: from sage.structure.element import Element
```

DELETE ITEM FROM PYDICT BY EXACT VALUE AND HASH

Beware that the implementation of the routine here relies on implementation details of CPython's dict that go beyond the published API. This file depends on python version when cythonized. It expects PY_VERSION_HEX to be available in the cythonization and the result depends on it (and needs to match the python version the C-compiler compiles it against). Usage should do something along the lines of

cythonize("dict_del_by_value.pyx", compile_time_env({"PY_VERSION_HEX": sys.hexversion}))

AUTHORS:

• Nils Bruin (2017-05)

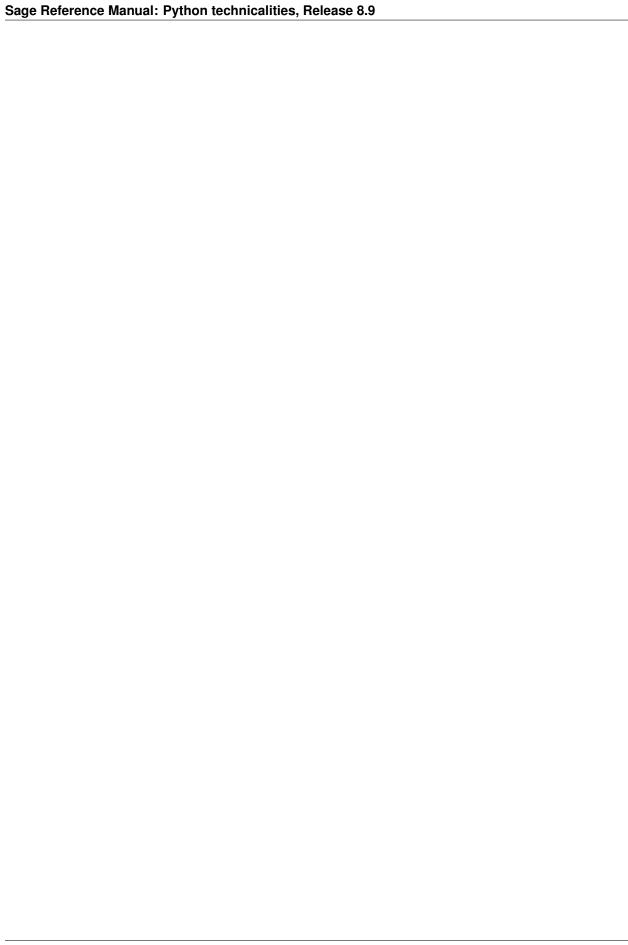

sage.cpython.dict_del_by_value.test_del_dictitem_by_exact_value (D, value, h) This function helps testing some cdef function used to delete dictionary items.

INPUT:

- D a Python dict.
- value an object that is value D.
- h the hash of the key under which to find value in D.

The underlying cdef function deletes an item from D that is in the hash bucket determined by h and whose value is identic with value. Of course, this only makes sense if the pairs (h, value) corresponding to items in D are pair-wise distinct.

If a matching item can not be found, the function does nothing and silently returns.
